DETAILED ACTION

Reasons for Allowance

1. The following is an examiner's statement of reasons for allowance: Applicant's response in view of the amendments and/or remarks filed on October 05, 2009 have been reviewed and respectfully considered. Applicant's arguments and/or amendments are believed to be persuasive, and therefore, the rejection of the previous office action has been withdrawn.

Upon further review and search, Claims 2, 4, 6-8, 10-16, 18-23 are considered allowable since when reading the claims in light of the specification, none of the references of record alone or in combination disclose or suggest the combination of limitations specified in independent claims 19, 21, 22 and 23, as further discussed below:

Referring to claims 19-20, the prior art searched and of record neither anticipates nor suggests a digital processor for recording adjustment and reproducing image data formed by imaging an object, said processor comprising: a recording adjustment circuit for adjusting color temperature in the image data, based on the image data, determining whether adjustment of the color temperature is optimum; a reproduction adjustment circuit for converting the image data to a desired color space based on: a first color space information; the color temperature information optimum for the first color space information; a second color space information, in order; a recording reproduction selector switch to select either recording or reproduction in a usual mode; and a common processor for commonly processing the image data from the recording adjustment circuit and the reproduction circuit, wherein the first color space information includes a standard prescription for a color space proposed by a manufacturer, and the second color space information defines a color space desired by a user of said processor.

Regarding claims 21, 2, 10-16 the prior art searched and of record neither anticipates nor suggests an apparatus for reproducing image data formed by imaging an object, said apparatus

Art Unit: 2625

comprising: a reader circuit for reading out image data, first color space information represented by a plurality of coefficients converting the image data in a color space set when imaging the object, and color temperature information optimum for the first color space information; a first color space corrector for correcting the image data based on the first color space information; a color temperature adjuster for correcting the image data corrected by said first color space corrector based on the color temperature information optimum for the first color space information; and a second color space corrector for correcting the image data adjusted by said color temperature adjuster based on second color space information represented by a plurality of coefficients converting the image data to a color space set in said apparatus, wherein the reader circuit reads out the image data in a form of raw pixel data, and wherein the first color space information includes a standard prescription for a color space proposed by a manufacturer, and the second color space information defines a color space desired by a user of said apparatus.

As to claims 22 and 4, the prior art searched and of record neither anticipates nor suggests a solid-state imaging apparatus, comprising: an image pickup device including an array of photosensitive cells for transducing incident light from an object field into an electrical image signal; said apparatus having a raw data mode for recording the image signal in a form of digitized, raw image data; an adjustment decision circuit for adjusting color temperature in the image data, based on the image data, determining whether or not adjustment of the color temperature is optimum for first color space information, and outputting gain adjustment information reflecting the color temperature resultant from determination; a recording adjuster for adjusting the raw image data based on second color space information including a plurality of coefficients for converting the raw image data to a color space used in imaging the object field and the gain adjustment information to a predetermined recording form; and a system controller for controlling said adjustment decision circuit and said recording adjuster, wherein the first color space information includes a standard prescription for a color space proposed by a manufacturer, and the second color space information defines a color space desired by a user of said apparatus.

Claims 23, 6-8 are also allowed for the reasons the prior art searched and of record neither anticipates nor suggests a digital camera wherein incident light from an object field is transduced by an image pickup device including an array of photosensitive cells into an electrical image signal, and in a raw data mode the image signal is recorded in a form of digitized, raw image data, said digital camera comprising: an adjustment decision circuit for adjusting color temperature in the image data, based on the image data, determining whether or not adjustment of the color temperature is optimum, and outputting gain adjustment information reflecting the color temperature resultant from determination; a writer/reader for adjusting the raw image data as well as first color space information including a plurality of coefficients for converting the raw image data to a color space used in imaging the object field and the gain adjustment information to a predetermined recording form, and for recording and reproducing the raw image data, the first color space information and the gain adjustment information; a first color space corrector for correcting the image data based on the first color space information; a color temperature adjuster for adjusting the image data corrected by said first color space corrector based on the gain adjustment information; a second color space corrector for correcting the image data adjusted by said color temperature adjuster based on second color space information represented by a plurality of coefficients converting the image data to a color space set in said digital camera; and a system controller for controlling said adjustment decision circuit, said writer/reader, said color temperature adjuster and said first and second color space correctors, wherein the first color space information includes a standard prescription for a color space proposed by a manufacturer, and the second color space information defines a color space desired by a user of said digital camera.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
